## SURFACE WATER SAMPLING RESULTS

### TVA KINGSTON FOSSIL PLANT FLY ASH RESPONSE HARRIMAN, ROANE COUNTY, TENNESSEE

#### INTRODUCTION

The Tetra Tech EM Inc. (Tetra Tech) Superfund Technical Assessment and Response Team (START) is submitting this report summarizing surface water sampling activities conducted at the Kingston Fossil Fly Ash Response in Harriman, Tennessee. EPA tasked Tetra Tech to collect surface water samples from areas within the Clinch, Emory, and Tennessee River systems. The purpose of the investigation was to provide an initial characterization of natural waters which may have been impacted by the release of fly ash into the river. EPA will use the data to determine the risks to public health and the environment. Tetra Tech conducted the investigation using the Field Branches Quality System and Technical Procedures located at <http://www.epa.gov/region4/sestd/fbqstp/>.

This letter report includes an attached figure depicting the sampling locations and tables showing a summary of the data.

#### SITUATION

On December 22, 2008, at approximately 0100 hours, the northeastern dike at the TVA Kingston Power Plant, located in Harriman, Roane County, Tennessee, failed. The dike retained one of three cells at the facility used for dewatering fly ash. Subsequently, approximately 5.4 million cubic yards of fly ash were released into two sloughs which flow into the Emory River. The release extended approximately 300 acres outside of the ash storage areas. Local emergency officials first responded to the scene, and then shortly thereafter, began to assist residents affected by the fly ash flow. Three residential homes became condemned as a result of the release.

On December 22, 2008, the National Response Center (NRC), and subsequently the U.S. Environmental Protection Agency (EPA) Region 4, was notified of the incident. A Federal On-Scene Coordinator (OSC) and Tetra Tech START contractor were mobilized to the TVA Kingston Power Plant Facility the same day.

#### SAMPLING ACTIVITIES

From December 23, 2008 to December 29, 2008, EPA's contractor, Tetra Tech, collected a total of 26 samples of surface water from the Tennessee, Clinch, and Emory Rivers. On December 23, 2008, EPA contractors accompanied TVA personnel in watercraft along an approximately 10-mile long stretch of the rivers. A total of 10 samples were collected and split between the two entities. The samples were analyzed by an independent off-site laboratory for a combination of Target Analyte List (TAL) total and dissolved metals (SW846 Method 6010B/7470A) and total suspended solids (EPA 160.2). On December 29, 2008, EPA contractors and TVA collected duplicate samples from 11 locations (including one quality control duplicate) at similar locations along the same path as that taken on December 23, 2008. The samples were analyzed by an off-site laboratory for TAL total and dissolved metals (SW846 Method 6010B/7470A), total dissolved silica (SW846 Method 6010B).

## SAMPLING RESULTS

The attached tables contain unvalidated summary analytical results for all EPA collected surface water data, sorted by date. Each table includes the Tennessee Water Quality Criteria for Domestic Water Supply (Rule 1200-4-3-.03) (TWQC) for comparative purposes. These criteria mirror the Federal Maximum Contaminant Levels for public water systems. Both the total and dissolved phases of each constituent were compared to TWQCs.

Analytical results from the samples collected on December 23, 2008 indicate levels of several constituents at or above their respective TWQCs. Sample KIF-ERM0.1 exceeded the TWQC for antimony, beryllium, cadmium, chromium, and lead in total analysis; and arsenic in both total and dissolved phase analysis.

In the report released on January 4, 2009, samples KIF-CRM5.5 and KIF-ERM4.0 were reported as exceeding the TWQC for total thallium. After further review of the laboratory quality control data, thallium was determined not to be detected in the sample.

Samples TT-ERM1.9 and TT-ERM1.9-DUP, a duplicate sample collected from the same location immediately following TT-ERM1.9 exceeded the TWQC for total arsenic. Sample KIF-CRM0.0 exceeded the TWQC for dissolved thallium.

Samples collected on December 28, 2008 showed fewer exceedances of the TWQCs than the samples collected on December 23, 2008. Sample 081228-ERER-WS02 and its duplicate exceeded the TWQC for total arsenic. In addition, 081228-ERER-WS02-DUP exceeded the TWQCs for dissolved thallium. The reproducibility of the total mercury exceedance previously report in sample 081228-ERER-WS02-DUP was verified. The lab reanalyzed the sample two additional times and the results showed no detection of mercury. Sample 081228-KCPS-WS04 exceeded the TWQC for total arsenic. Comparing the two data sets, a general decrease in total suspended solids (TSS) and metal concentration is observed. The data indicates that settling of the released ash has reduced particulate and metal levels in the water column. Dispersion may also be a factor in reduced contaminant measurements.

As of January 4, 2008, samples collected from upstream locations along the Clinch and Emory Rivers are currently at the laboratory awaiting analysis.

As of January 3, 2008, TVA had collected 60 water samples, utilizing 10 consistent locations along the river system to allow for comparison of the data.

## CONCLUSION

This report provides an initial characterization of the river. Elevated levels of metals have been measured in the Clinch and Emory Rivers following the ash release. River sediments were not sampled in this study. EPA recommends continued characterization of the Emory and Clinch Rivers throughout the duration of the clean up.
